 $a[0][1][2]$

$a = [1]$
 $a = [1, 2]$

P.S

Create a variable called patient_details:

take list as input & store patient info:

→ name, place, email, age

when asked for patient details use id to get the name & age only.

Assignment 2

Problem:

1. Create a single variable called `patient_details`:
2. Take a list as input & store patient info: name, place, email, age.
3. When asked for a patient's details, use the patient ID to get the name and age only.

Hint* - This requires a new code / function that we have not learned yet. You are free to use any resources available to you to solve the problem.
