

03 - 05 - 2025

Agenda:

Packages

OOP →

Class & object

self

\_\_init\_\_

method

attributes

→ Inheritance

→ Encapsulation

→ Polymorphism

→ Abstraction

Module →

· py file

→ function

→ class

→ modular programming

→ cleaner code

→ easy to maintain

calc.py →

=====

package: → collection of modules

Math

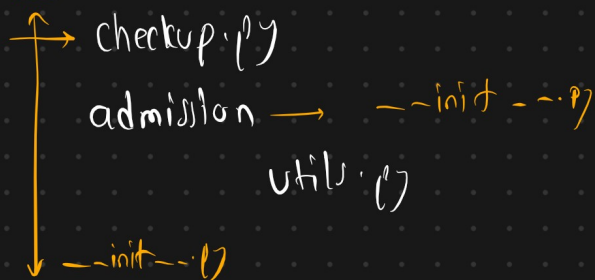

→ algebra.py

trigonometry.py

stats.py

calculus.py

hospital

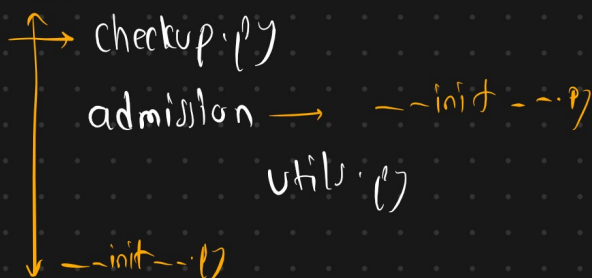

hospital: checkup import \*

hospital: admission

① create a `--init--.py` inside a package directory

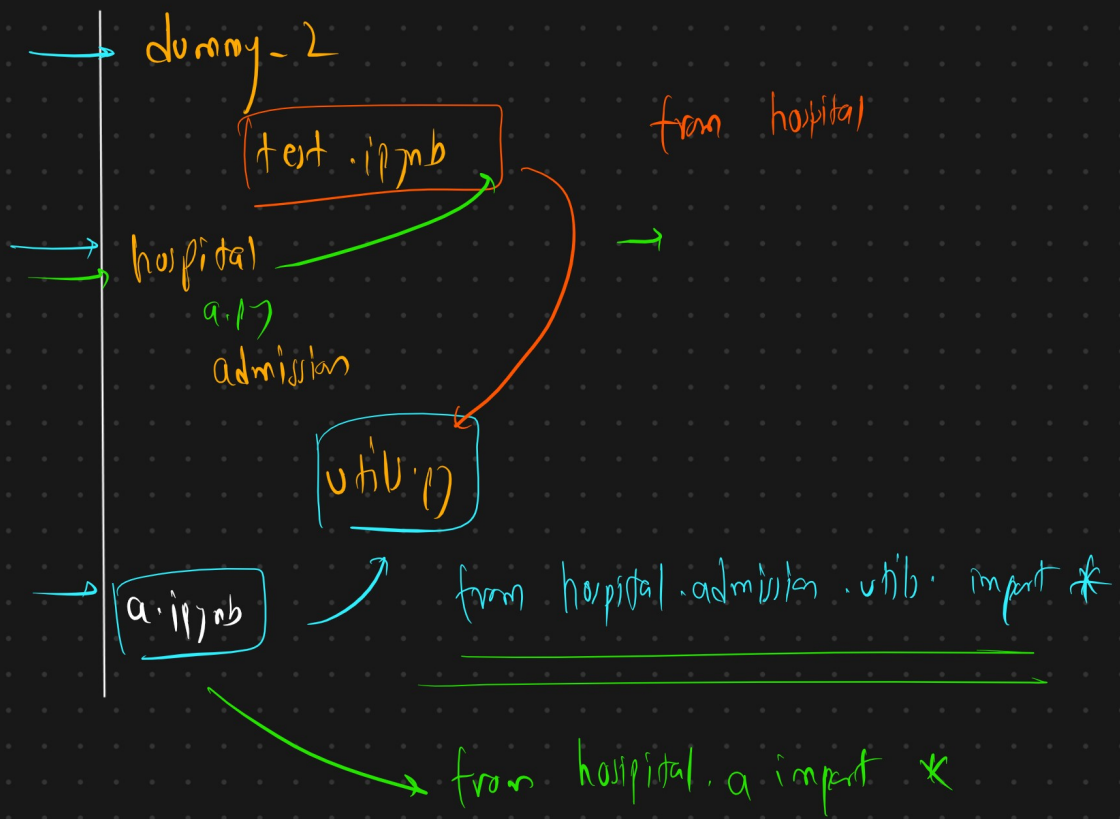

hospital

03-05-2025.ipynb

dummy

module  
package

OOP's

Inheritance →

we are inheriting  
our parent's

properties from

neighbo → lab d m

C:

memd →  
holds

C: memd

1 → cover h

class TV:

def turn\_on(self):  
print("TV is now ON.")

tv = TV() → (tv. turn\_on())

class AC:

def turn\_on(self):  
print("AC is cooling the room.")

ac = AC() → (ac. turn\_on())

variable → address

def activate(var):  
var. turn\_on()

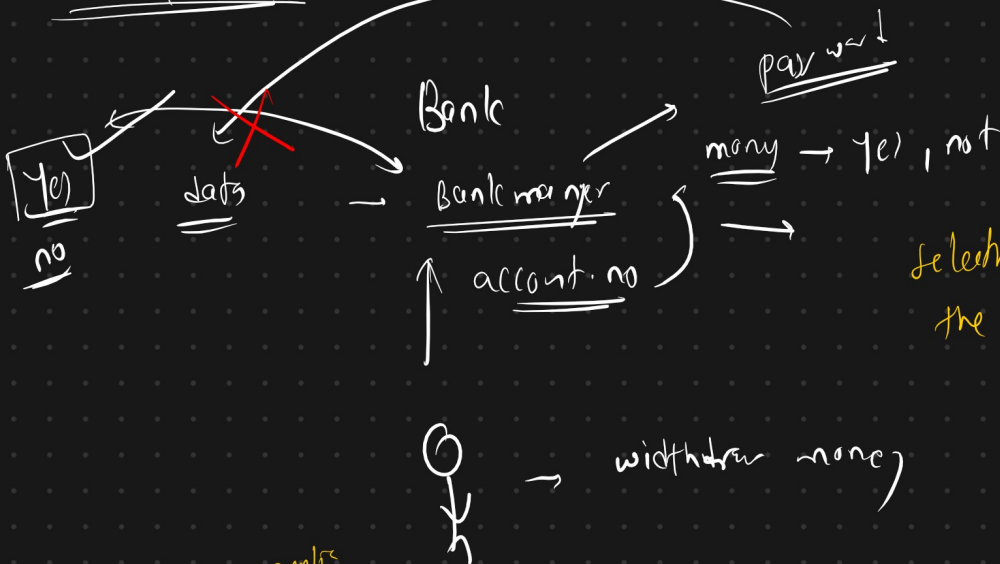

```
class TV1990:
    def turn_on(self):
        print("1990 TV is now ON.")
```

```
class TV2000(TV1990):
    def turn_on(self):
        print("2000 TV is now ON.")
```

method overriding

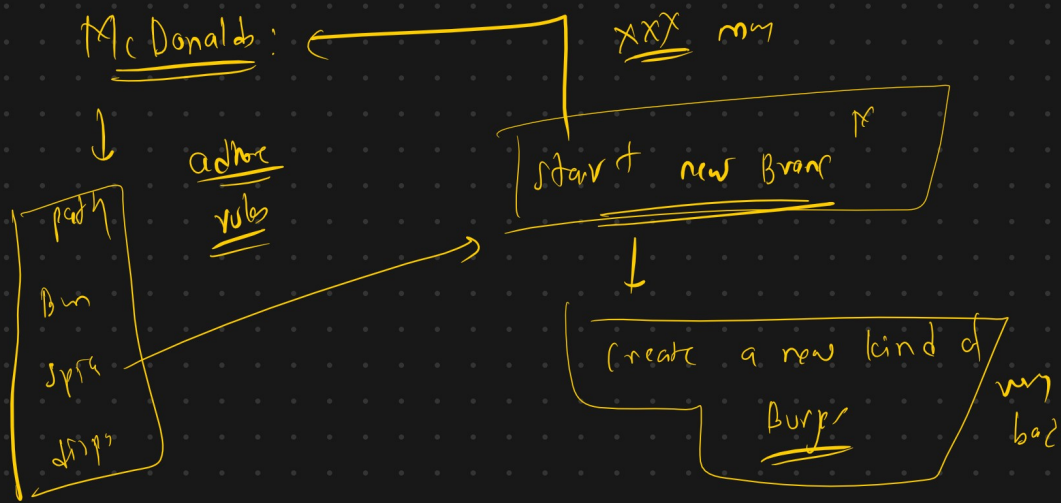

Encapsulation!

selectively mention  
the scope of  
data

OOP →

- Inheritance ①
- polymorphism → override
- Encapsulation ②
- Abstraction ③

OOP → super

- modular, code reusability
- manage code
- security
- standard
- standard behavior
